1 Floquet Fermi Goldern Rule

In this section we are going to derive the Floquet Fermi goldern rule for above derived quantum Floquet states using $t - t'$ formalism.

The Floquet states (??) fullfills the $t - t'$ Schrödinger equation [*Ref:myReport] as follows

$$i\hbar \frac{\partial}{\partial t} |\psi_\alpha(t, t')\rangle = H_F(t') |\psi_\alpha(t, t')\rangle \quad (1.1)$$

where Floquet Hamiltonian given by

$$H_F(t') \equiv H_e(t) - i\hbar \frac{d}{dt} \quad (1.2)$$

and

$$|\psi_\alpha(t, t')\rangle = \exp\left(-\frac{i}{\hbar} \varepsilon_\alpha t\right) |\phi_\alpha(t')\rangle \quad (1.3)$$

Now for the Eq. (1.1) corresponding time evolution operator satisfy the Schrödinger equation

$$U_0(t, t_0; t') = \exp\left(-\frac{i}{\hbar} H_F(t') [t - t_0]\right) \quad (1.4)$$

Consider a time-independent total perturbation $V(\mathbf{r})$ switched on at the reference time $t = t_0$, then Schrödinger equation becomes

$$i\hbar \frac{\partial}{\partial t} |\Psi_\alpha(t, t')\rangle = [H_F(t') + V(\mathbf{r})] |\Psi_\alpha(t, t')\rangle \quad (1.5)$$

and when $t \leq t_0$ both solutions of the Schrödinger equation coincide

$$|\psi_\alpha(t, t')\rangle = |\Psi_\alpha(t, t')\rangle \quad \text{when } t \leq t_0 \quad (1.6)$$

Now, we can introduce the interaction picture representation of the $t - t'$ Floquet state as

$$|\Psi_\alpha(t, t')\rangle_I = U_0^\dagger(t, t_0; t') |\Psi_\alpha(t, t')\rangle \quad (1.7)$$

and the perturbation in the interaction picture will be

$$V_I(\mathbf{r}) = U_0^\dagger(t, t_0; t') V(\mathbf{r}) U_0(t, t_0; t') = V(\mathbf{r}). \quad (1.8)$$

This leads to the Schrödinger equation in the interaction picture

$$i\hbar \frac{\partial}{\partial t} |\Psi_\alpha(t, t')\rangle_I = V_I(\mathbf{r}) |\Psi_\alpha(t, t')\rangle_I \quad (1.9)$$

with the recursive solution

$$|\Psi_\alpha(t, t')\rangle_I = |\Psi_\alpha(t_0, t')\rangle_I + \frac{1}{i\hbar} \int_{t_0}^t dt_1 V_I(\mathbf{r}) |\Psi_\alpha(t_1, t')\rangle_I \quad (1.10)$$

Iterating the solution only upto first order (Born approximation) this leads to

$$|\Psi_\alpha(t, t')\rangle_I \approx |\psi_\alpha(t_0, t')\rangle + \frac{1}{i\hbar} \int_{t_0}^t dt_1 V_I(\mathbf{r}) |\psi_\alpha(t_0, t')\rangle \quad (1.11)$$

and multiply it by $\langle\psi_\beta(t_0, t')|$ and we will get

$$\langle\psi_\beta(t_0, t')|\Psi_\alpha(t, t')\rangle_I = \langle\psi_\beta(t_0, t')|\psi_\alpha(t_0, t')\rangle + \frac{1}{i\hbar} \int_{t_0}^t dt_1 \langle\psi_\beta(t_0, t')| V_I(\mathbf{r}) |\psi_\alpha(t_0, t')\rangle. \quad (1.12)$$

Then introducing unitary operator U_0 we can re-write this as

$$\begin{aligned} \langle\psi_\beta(t_0, t')|U_0^\dagger(t, t_0; t')|\Psi_\alpha(t, t')\rangle &= \langle\psi_\beta(t_0, t')|U_0^\dagger(t, t_0; t')U_0(t, t_0; t')|\psi_\alpha(t_0, t')\rangle \\ &+ \frac{1}{i\hbar} \int_{t_0}^t dt_1 \langle\psi_\beta(t_0, t')|U_0^\dagger(t_1, t_0; t')V(\mathbf{r})U_0(t_1, t_0; t')|\psi_\alpha(t_0, t')\rangle \end{aligned} \quad (1.13)$$

and this can be simplified as

$$\langle\psi_\beta(t, t')|\Psi_\alpha(t, t')\rangle = \langle\psi_\beta(t, t')|\psi_\alpha(t, t')\rangle + \frac{1}{i\hbar} \int_{t_0}^t dt_1 \langle\psi_\beta(t_1, t')| V(\mathbf{r}) |\psi_\alpha(t_1, t')\rangle. \quad (1.14)$$

Since our $t - t'$ Floquet states are orthonormal [*Ref:myReport- t-t' formalism] we can derive that

$$\langle\psi_\beta(t, t')|\Psi_\alpha(t, t')\rangle = \delta_{\alpha\beta} \exp(i\omega[t' - t]) + \frac{1}{i\hbar} \int_{t_0}^t dt_1 \langle\psi_\beta(t_1, t')| V(\mathbf{r}) |\psi_\alpha(t_1, t')\rangle. \quad (1.15)$$

Now, set $t_0 = 0$ and for a case $\alpha \neq \beta$ where we can represent $\alpha = (n_\alpha, m_\alpha)$ and $\beta = (n_\beta, m_\beta)$ and this will simplified to

$$\langle\psi_\beta(t, t')|\Psi_\alpha(t, t')\rangle = -\frac{i}{\hbar} \int_0^t dt_1 \langle\psi_\beta(t_1, t')| V(\mathbf{r}) |\psi_\alpha(t_1, t')\rangle. \quad (1.16)$$

In addition, since our Floquet states create a basis for composite space we can represent any solution using our Floquet states

$$|\Psi_\alpha(t, t')\rangle = \sum_{\beta} a_{\alpha\beta}(t, t') |\psi_\beta(t, t')\rangle. \quad (1.17)$$

Therefore we can derive a equation for this *scattering amplitude* as

$$a_{\alpha\beta}(t, t') = \langle\psi_\beta(t, t')|\Psi_\alpha(t, t')\rangle = -\frac{i}{\hbar} \int_0^t dt_1 \langle\psi_\beta(t_1, t')| V(\mathbf{r}) |\psi_\alpha(t_1, t')\rangle. \quad (1.18)$$

Now lets assume a scattering event from a $t - t'$ Floquet state $|\psi_\beta(t, t')\rangle$ into another $t - t'$ Floquet state $|\Psi_\alpha(t, t')\rangle$ with constant quansienenergy ε given as follows

$$|\Psi_\alpha(t, t')\rangle = \exp\left(-\frac{i}{\hbar}\varepsilon t\right) |\Phi_\alpha(t')\rangle \quad (1.19)$$

Now consider a scattering event

$$\psi_\beta(\mathbf{k}', t, t') = \exp\left(-\frac{i}{\hbar}\varepsilon_\beta t\right) \phi_\beta(\mathbf{k}', t') \longrightarrow \Psi_\alpha(\mathbf{k}, t, t') = \exp\left(-\frac{i}{\hbar}\varepsilon t\right) \Phi_\alpha(\mathbf{k}, t') \quad (1.20)$$

Figure 1: Scattering from $|\psi_\beta(t, t')\rangle$ to constant energy state $|\Psi_\alpha(t, t')\rangle$ due to scattering potential created by impurities.

Here we need to understand a state of this considering system only be represented by two independent quantum numbers which are n energy eigen states and m quantum number which represents the quantized momentum in x direction values. Let's calculate the scattering amplitude of the above mentioned scattering scenario using the equation derived in (1.18).

$$\begin{aligned} a_{\alpha\beta}(\mathbf{k}', \mathbf{k}, t, t') &= -\frac{i}{\hbar} \int_0^t dt_1 \langle \psi_{\beta, \mathbf{k}'}(t_1, t') | V(\mathbf{r}) | \psi_{\alpha, \mathbf{k}}(t_1, t') \rangle \\ &= -\frac{i}{\hbar} \int_0^t dt_1 e^{\frac{i}{\hbar}(\varepsilon_\beta - \varepsilon)t_1} \langle \phi_{\beta, \mathbf{k}'}(t') | V(\mathbf{r}) | \phi_{\alpha, \mathbf{k}}(t') \rangle \end{aligned} \quad (1.21)$$

Next assuming this scenario for long time $t \rightarrow \infty$ we can turn this integral into a delta distribution as follows

$$\begin{aligned} a_{\alpha\beta}(\mathbf{k}', \mathbf{k}, t, t') &= -\frac{i}{\hbar} \lim_{t \rightarrow \infty} \left[\int_{-t/2}^{t/2} dt_1 e^{\frac{i}{\hbar}(\varepsilon_\beta - \varepsilon)t_1} \langle \phi_{\beta, \mathbf{k}'}(t') | V(\mathbf{r}) | \phi_{\alpha, \mathbf{k}}(t') \rangle \right] \\ &= -2\pi i \delta(\varepsilon_\beta - \varepsilon) \langle \phi_{\beta, \mathbf{k}'}(t') | V(\mathbf{r}) | \phi_{\alpha, \mathbf{k}}(t') \rangle \end{aligned} \quad (1.22)$$

Now let's consider about the inner product of the above derivation. Using completeness properties we can write that as follows

$$\begin{aligned} Q &\equiv \langle \phi_{\beta, \mathbf{k}'}(t') | V(\mathbf{r}) | \phi_{\alpha, \mathbf{k}}(t') \rangle \\ &= \sum_{\mathbf{k}} \sum_{\mathbf{k}'} \langle \phi_{\beta, \mathbf{k}'}(t') | \mathbf{k}' \rangle \langle \mathbf{k}' | V(\mathbf{r}) | \mathbf{k} \rangle \langle \mathbf{k} | \phi_{\alpha, \mathbf{k}}(t') \rangle \end{aligned} \quad (1.23)$$

and separating x and y directional momentums we can modify this as follows (Assuming $L_y \rightarrow \infty$) and then using $\frac{1}{L_y} \sum_{k_y} = \frac{1}{2\pi} \int k_y$

$$\begin{aligned} Q &\equiv \langle \phi_{\beta, \mathbf{k}'}(t') | V(\mathbf{r}) | \phi_{\alpha, \mathbf{k}}(t') \rangle \\ &= \frac{L_y^2}{4\pi^2} \sum_{k_x} \sum_{k'_x} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} dk_y dk'_y \phi_{\beta}(\mathbf{k}', t') \langle \mathbf{k}' | V(\mathbf{r}) | \mathbf{k} \rangle \phi_{\alpha}(\mathbf{k}, t'). \end{aligned} \quad (1.24)$$

For a random white scattering potential we can represent the inner product of scattering potential with momentum as a constant value as

$$V_{\mathbf{k}', \mathbf{k}} \equiv \langle \mathbf{k}' | V(\mathbf{r}) | \mathbf{k} \rangle. \quad (1.25)$$

In this study, the perturbation potential is assumed to be formed by an ensemble of randomly distributed impurities, since random impurities in a disordered metal is a better approximation for experimental results.

Consider N_{imp} identical impurities positioned at the randomly distributed but fixed positions \mathbf{r}_i . The elastic scattering potential $V(\mathbf{r})$ is then given by the sum over uncorrelated single impurity potentials $v(\mathbf{r})$

$$V(\mathbf{r}) \equiv \sum_{i=1}^{N_{imp}} v(\mathbf{r} - \mathbf{r}_i). \quad (1.26)$$

Now assume that the perturbation $V(\mathbf{r})$ is a Gaussian random potential where one can choose the zero of energy such that the potential is zero on average. This model characterized by [*Ref: e.Akkermans G. Montambaux]

$$\langle v(\mathbf{r}) \rangle_{imp} = 0 \quad (1.27)$$

$$\langle v(\mathbf{r})v(\mathbf{r}') \rangle_{imp} = \Upsilon(\mathbf{r} - \mathbf{r}') \quad (1.28)$$

where $\langle \cdot \rangle_{imp}$ denoted the average over realizations of the impurity disorder. In addition, this model assume that $v(\mathbf{r} - \mathbf{r}')$ only depends on the position difference $|\mathbf{r} - \mathbf{r}'|$ and it decays with a characteristic length r_c . Since the study considers the case where the waveleagth of radiation or scattering electrons is much faster than r_c , it is good approximation to make two-point correlation function to be

$$\langle v(\mathbf{r})v(\mathbf{r}') \rangle_{imp} = \Upsilon_{imp}^2 \delta(\mathbf{r} - \mathbf{r}') \quad (1.29)$$

and a random potential $V(\mathbf{r})$ with this property is called white noise [*Ref: e.Akkermans G. Montambaux]. Then we can choose approximately total scattering potential as

$$V(\mathbf{r}) = \sum_{i=1}^{N_{imp}} \Upsilon_{imp} \delta(\mathbf{r} - \mathbf{r}_i). \quad (1.30)$$

Now we can calculate the Eq. (1.25) using this assumption as follows

$$\begin{aligned} V_{\mathbf{k}', \mathbf{k}} &= \langle \mathbf{k}' | V(\mathbf{r}) | \mathbf{k} \rangle \\ &= \left\langle \mathbf{k}' \left| \sum_{i=1}^{N_{imp}} \Upsilon_{imp} \delta(\mathbf{r} - \mathbf{r}_i) \right| \mathbf{k} \right\rangle \\ &= \left\langle \mathbf{k}' \left| \sum_{i=1}^{N_{imp}} \Upsilon_{imp} \delta(x - x_i) \delta(y - y_i) \right| \mathbf{k} \right\rangle \\ &= \left\langle k'_x \left| \sum_{x_i=1}^{N_{imp}} \Upsilon_{imp} \delta(x - x_i) \right| k_x \right\rangle \sum_{y_i=1}^{N_{imp}} \int_{-\infty}^{\infty} dy e^{ik'_y y} \delta(y - y_i) e^{-ik_y y} \\ &= \left\langle k'_x \left| \sum_{x_i=1}^{N_{imp}} \Upsilon_{imp} \delta(x - x_i) \right| k_x \right\rangle \sum_{y_i=1}^{N_{imp}} e^{i(k'_y - k_y) y_i} \end{aligned} \quad (1.31)$$

Assuming the total umber of scatterers N_{imp} is macroscopically large we can achieve following expression

$$\begin{aligned} V_{\mathbf{k}', \mathbf{k}} &= \left\langle k'_x \left| \sum_{x_i=1}^{N_{imp}} \Upsilon_{imp} \delta(x - x_i) \right| k_x \right\rangle \frac{N_{imp}}{L_y} \int_{-\infty}^{\infty} dy e^{i(k'_y - k_y) y} \\ &= \frac{N_{imp}}{L_y} V_{k'_x, k_x} \delta(k'_y - k_y) \end{aligned} \quad (1.32)$$

where

$$V_{k'_x, k_x} \equiv \left\langle k'_x \left| \sum_{x_i=1}^{N_{imp}} \Upsilon_{imp} \delta(x - x_i) \right| k_x \right\rangle \quad (1.33)$$

Therefore, using the Eq. (??), the Eq. (1.24) modified to (we can change variable $t' \rightarrow t$)

$$\begin{aligned} Q &= \sum_{k_x} \sum_{k'_x} \frac{N_{imp} L_y V_{k'_x, k_x}}{4\pi^2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} dk_y dk'_y \delta(k'_y - k_y) \\ &\quad \times \sqrt{L_x} \exp(-ib \sin(2\omega t)) \exp(ik'_y [d \sin(\omega t) + y'_0]) \tilde{\chi}_{n_\beta}(k'_y - g \cos(\omega t)) \\ &\quad \times \sqrt{L_x} \exp(ib \sin(2\omega t)) \exp(-ik_y [d \sin(\omega t) + y_0]) \tilde{\chi}_{n_\alpha}(k_y - g \cos(\omega t)) \end{aligned} \quad (1.34)$$

and we can simplify this as

$$Q = \sum_{k_x} \sum_{k'_x} \frac{N_{imp} L_x L_y V_{k'_x, k_x}}{4\pi^2} \int_{-\infty}^{\infty} dk_y \times \exp(ik_y y'_0) \tilde{\chi}_{n_\beta}(k_y - g \cos(\omega t)) \exp(-ik_y y_0) \tilde{\chi}_{n_\alpha}(k_y - g \cos(\omega t)) \quad (1.35)$$

and this can re-write as

$$Q = \sum_{k_x} \sum_{k'_x} \frac{N_{imp} L_x L_y V_{k'_x, k_x}}{4\pi^2} I \quad (1.36)$$

where

$$I \equiv \int_{-\infty}^{\infty} dk_y \tilde{\chi}_{n_\beta}(k_y - g \cos(\omega t)) \tilde{\chi}_{n_\alpha}(k_y - g \cos(\omega t)) \exp(-ik_y [y_0 - y'_0]). \quad (1.37)$$

To avoid the energy transmission from external high-frequency field and electrons in the system, the applied radiation should be purely dressing field. Therefore, the only effect of the dressing field on 2DEG is the renormalization of the probability of elastic electron scattering within same Landau level ($n_\alpha = n_\beta$). Therefore Eq. (1.37) can be modified to

$$I \equiv \int_{-\infty}^{\infty} dk_y \tilde{\chi}_{n_\beta}^2(k_y - g \cos(\omega t)) \exp(-ik_y [y_0 - y'_0]). \quad (1.38)$$

Lets consider about this integral and we can calculate it as using the following substitution. Let

$$k_y - g \cos(\omega t) = \bar{k}_y \longrightarrow dk_y = d\bar{k}_y \quad (1.39)$$

and this leads to

$$I \equiv 2\pi \times \frac{1}{2\pi} \int_{-\infty}^{\infty} d\bar{k}_y \tilde{\chi}_{n_\alpha}^2(\bar{k}_y) \exp(-i(\bar{k}_y + g \cos(\omega t))(y_0 - y'_0)). \quad (1.40)$$

Using Fourier transform of Gauss-Hermite functions and convolution theorem we can write this as

$$I \equiv 2\pi \exp(g[y'_0 - y_0] \cos(\omega t)) \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y). \quad (1.41)$$

Therefore the scattering amplitude (1.22) will modified to

$$a_{\alpha\beta}(k'_x, k_x, t) = -2\pi i \delta(\varepsilon_\beta - \varepsilon) \sum_{k_x} \sum_{k'_x} \frac{N_{imp} L_x L_y V_{k'_x, k_x}}{4\pi^2} I \quad (1.42)$$

Considering quantized momentum given in x direction derived in Eq. (??), we can identify the non-zero values for scattering amplitude using following conditions

$$k'_x = \frac{p_{x_\beta}}{\hbar} = m' \frac{2\pi}{L_x} \quad \text{and} \quad k_x = \frac{p_{x_\alpha}}{\hbar} = m \frac{2\pi}{L_x}. \quad (1.43)$$

Then we can simplified scattering amplitude for given k'_x and k_x as

$$a_{\alpha\beta}(k'_x, k_x, t) = \delta(\varepsilon_\beta - \varepsilon) \left[\frac{-i N_{imp} L_x L_y V_{k'_x, k_x}}{2\pi} \right] \exp(g[y'_0 - y_0] \cos(\omega t)) \times \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y) \quad (1.44)$$

Since this scattering amplitude is time-periodic we can write this as a Fourier series expansion

$$a_{\alpha\beta}(k'_x, k_x, t) = \sum_{l=-\infty}^{\infty} a_{\alpha\beta}^l(k'_x, k_x) e^{-il\omega t}. \quad (1.45)$$

In addition, using Jacobi-Anger expansion

$$e^{iz \cos(\theta)} = \sum_{l=-\infty}^{\infty} i^l J_l(z) e^{-il\theta} \quad (1.46)$$

we can re-write the Eq.(1.44) as follows

$$a_{\alpha\beta}(k'_x, k_x, t) = \delta(\varepsilon_\beta - \varepsilon) \left[\frac{-iN_{imp}L_xL_yV_{k'_x, k_x}}{2\pi} \right] \sum_{l=-\infty}^{\infty} i^l J_l(g[y'_0 - y_0]) e^{-il\omega t} \times \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y) \quad (1.47)$$

$$a_{\alpha\beta}(k'_x, k_x, t) = \sum_{l=-\infty}^{\infty} \delta(\varepsilon_\beta - \varepsilon) \left[\frac{-i^{l+1}N_{imp}L_xL_yV_{k'_x, k_x}}{2\pi} \right] J_l(g[y'_0 - y_0]) \times \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y) e^{-il\omega t} \quad (1.48)$$

Then we can identified the Fourier series component as

$$a_{\alpha\beta}^l(k'_x, k_x) = \delta(\varepsilon_\beta - \varepsilon) \left[\frac{-i^{l+1}N_{imp}L_xL_yV_{k'_x, k_x}}{2\pi} \right] J_l(g[y'_0 - y_0]) \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y) \quad (1.49)$$

Now one can introduce the definition of the *transition probability matrix* as

$$(A_{\alpha\beta}(k'_x, k_x))_{l,l'} \equiv a_{\alpha\beta}^l(k'_x, k_x) [a_{\alpha\beta}^{l'}(k'_x, k_x)]^* \quad (1.50)$$

and this becomes

$$(A_{\alpha\beta}(k'_x, k_x))_{l,l'} = \left[\frac{N_{imp}^2 A^2 |V_{k'_x, k_x}|^2}{4\pi^2} \right] J_l(g[y'_0 - y_0]) J_{l'}(g[y'_0 - y_0]) \delta^2(\varepsilon_\beta - \varepsilon) \times \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y) \int_{-\infty}^{\infty} d\bar{y} \chi_{n_\beta}(\bar{y}) \chi_{n_\beta}(y_0 - y'_0 - \bar{y}). \quad (1.51)$$

We can reduce these intragal into one variable and derive

$$(A_{\alpha\beta}(k'_x, k_x))_{l,l'} = \left[\frac{N_{imp}^2 A^2 |V_{k'_x, k_x}|^2}{4\pi^2} \right] J_l(g[y'_0 - y_0]) J_{l'}(g[y'_0 - y_0]) \delta^2(\varepsilon_\beta - \varepsilon) \times \left| \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y) \right|^2. \quad (1.52)$$

Then desribing the square of the delta distribution using following procedure

$$\delta^2(\varepsilon) = \delta(\varepsilon) \delta(0) = \frac{\delta(\varepsilon)}{2\pi\hbar} \int_{-t/2}^{t/2} e^{i0 \times t'/\hbar} dt' = \frac{\delta(\varepsilon)t}{2\pi\hbar} \quad (1.53)$$

one can modify our derivation in Eq. (1.51) as

$$(A_{\alpha\beta}(k'_x, k_x))_{l,l'} = \left[\frac{N_{imp}^2 A^2 |V_{k'_x, k_x}|^2}{4\pi^2} \right] J_l(g[y'_0 - y_0]) J_{l'}(g[y'_0 - y_0]) \delta(\varepsilon_\beta - \varepsilon) \frac{t}{2\pi\hbar} \times \left| \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y) \right|^2. \quad (1.54)$$

Then performing thetime derivation of each matrix element yeild the *transition amplitude matrix* as follows

$$\Gamma_{\alpha\beta}^{ll'}(k'_x, k_x) \equiv \frac{d(A_{\alpha\beta}(k'_x, k_x))_{l,l'}}{dt} = \Lambda |V_{k'_x, k_x}|^2 \delta(\varepsilon_\beta - \varepsilon) J_l(g[y'_0 - y_0]) J_{l'}(g[y'_0 - y_0]) \left| \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta}(y_0 - y'_0 - y) \right|^2 \quad (1.55)$$

where

$$\Lambda \equiv \frac{N_{imp}^2 A^2}{8\pi^3 \hbar} \quad (1.56)$$

Now using definition of y_0 given in Eq. (??) we can write that

$$y_0 - y'_0 = -\frac{p_{x_\alpha}}{eB} + \frac{p_{x_\beta}}{eB} = \frac{\hbar k'_x}{eB} - \frac{\hbar k_x}{eB} = \frac{\hbar}{eB} [k'_x - k_x] \quad (1.57)$$

and this leads Eq. (1.56) to

$$\begin{aligned} \Gamma_{\alpha\beta}^{ll'}(k'_x, k_x) &= \Lambda |V_{k'_x, k_x}|^2 \delta(\varepsilon_\beta - \varepsilon) J_l \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) J_{l'} \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \\ &\times \left| \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta} \left(\frac{\hbar}{eB} [k'_x - k_x] - y \right) \right|^2 \end{aligned} \quad (1.58)$$

An impurity average of white noise potential allows to identify $\langle |V_{k'_x, k_x}|^2 \rangle = V_{imp}$ and the inverse scattering time matrix is the sum over all momentum over the transition probability matrix

$$\left(\frac{1}{\tau(\varepsilon, k_x)} \right)_{\alpha\beta}^{ll'} \equiv \frac{1}{L_x} \sum_{k'_x} \langle \Gamma_{\alpha\beta}^{ll'}(k'_x, k_x) \rangle_{imp} \quad (1.59)$$

and this implies

$$\begin{aligned} \Gamma_{\alpha\beta}^{ll'}(k'_x, k_x) &= \frac{\Lambda V_{imp}}{L_x} \sum_{k'_x} \delta(\varepsilon_\beta - \varepsilon) J_l \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) J_{l'} \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \\ &\times \left| \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta} \left(\frac{\hbar}{eB} [k'_x - k_x] - y \right) \right|^2 \end{aligned} \quad (1.60)$$

For the 1-dimentional case introduce the momentum continuum limit as follows

$$\frac{1}{L_x} \sum_{k'_x} \longrightarrow \frac{1}{2\pi} \int dk'_x \quad (1.61)$$

and this leads to

$$\begin{aligned} \left(\frac{1}{\tau(\varepsilon, k_x)} \right)_{\alpha\beta}^{ll'} &= \frac{\Lambda V_{imp}}{2\pi} \delta(\varepsilon_\beta - \varepsilon) \int_{-\infty}^{\infty} dk'_x J_l \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) J_{l'} \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \\ &\times \left| \int_{-\infty}^{\infty} dy \chi_{n_\beta}(y) \chi_{n_\beta} \left(\frac{\hbar}{eB} [k'_x - k_x] - y \right) \right|^2 \end{aligned} \quad (1.62)$$

Using following substitution

$$y = \frac{\hbar \bar{k}}{eB} \longrightarrow dy = \frac{\hbar}{eB} d\bar{k} \quad (1.63)$$

we can modify above derivation as

$$\begin{aligned} \left(\frac{1}{\tau(\varepsilon, k_x)} \right)_{\alpha\beta}^{ll'} &= \frac{\Lambda V_{imp}}{2\pi} \delta(\varepsilon_\beta - \varepsilon) \int_{-\infty}^{\infty} dk'_x J_l \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) J_{l'} \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \\ &\times \left(\frac{\hbar}{eB} \right)^2 \left| \int_{-\infty}^{\infty} d\bar{k} \chi_{n_\beta} \left(\frac{\hbar}{eB} \bar{k} \right) \chi_{n_\beta} \left(\frac{\hbar}{eB} [k'_x - k_x - \bar{k}] \right) \right|^2, \end{aligned} \quad (1.64)$$

and finally we can derive our expression for the *inverse scattering time matrix* for N th Landau level (let $n_\alpha = n_\beta = N$)

$$\begin{aligned} \left(\frac{1}{\tau(\varepsilon, k_x)} \right)_N^{ll'} &= \frac{N_{imp}^2 A^2 \hbar V_{imp}}{16\pi^4 (eB)^2} \delta(\varepsilon - \varepsilon_N) \int_{-\infty}^{\infty} dk'_x J_l \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) J_{l'} \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \\ &\times \left| \int_{-\infty}^{\infty} d\bar{k} \chi_N \left(\frac{\hbar}{eB} \bar{k} \right) \chi_N \left(\frac{\hbar}{eB} [k'_x - k_x - \bar{k}] \right) \right|^2. \end{aligned} \quad (1.65)$$

■

2 Inverse Scattering Time Analysis

We have derived the inverse scattering time matrix element from previous section as follows

$$\left(\frac{1}{\tau(\varepsilon, k_x)}\right)_N^{ll'} = \frac{N_{imp}^2 A^2 \hbar V_{imp}}{16\pi^4 (eB)^2} \delta(\varepsilon - \varepsilon_N) \int_{-\infty}^{\infty} dk'_x J_l \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) J_{l'} \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \times \left| \int_{-\infty}^{\infty} d\bar{k} \chi_N \left(\frac{\hbar}{eB} \bar{k} \right) \chi_N \left(\frac{\hbar}{eB} [k'_x - k_x - \bar{k}] \right) \right|^2. \quad (2.1)$$

The disorder in the system is not supposed to change the eigenenergies of the bare system, hence all off-diagonal elements of the self-energy were neglected. Therefore we can consider only the central diagonal element ($l = l' = 0$) of the inverse scattering time matrix which has the largest contribution

$$\left(\frac{1}{\tau(\varepsilon, k_x)}\right)_N^{00} = \frac{N_{imp}^2 A^2 \hbar V_{imp}}{16\pi^4 (eB)^2} \delta(\varepsilon - \varepsilon_N) \int_{-\infty}^{\infty} dk'_x J_0^2 \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \times \left| \int_{-\infty}^{\infty} d\bar{k} \chi_N \left(\frac{\hbar}{eB} \bar{k} \right) \chi_N \left(\frac{\hbar}{eB} [k'_x - k_x - \bar{k}] \right) \right|^2. \quad (2.2)$$

Now we can introduce a new parameter with physical meaning of scattering-induced broadening of the Landau level as follows

$$\Gamma_N^{00}(\varepsilon, k_x) \equiv \hbar \left(\frac{1}{\tau(\varepsilon, k_x)} \right)_N^{00} \quad (2.3)$$

and this modify our previous expressing as

$$\Gamma_N^{00}(\varepsilon, k_x) = \frac{N_{imp}^2 A^2 \hbar^2 V_{imp}}{16\pi^4 (eB)^2} \delta(\varepsilon - \varepsilon_N) \int_{-\infty}^{\infty} dk'_x J_0^2 \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \times \left| \int_{-\infty}^{\infty} d\bar{k} \chi_N \left(\frac{\hbar}{eB} \bar{k} \right) \chi_N \left(\frac{\hbar}{eB} [k'_x - k_x - \bar{k}] \right) \right|^2. \quad (2.4)$$

In addition, for the case of elastic scattering within the same Landau level, one can present the delta distribution of the energy using the same physical interpretation as follows

$$\delta(\varepsilon - \varepsilon_N) \approx \frac{1}{\pi \Gamma_N^{00}(\varepsilon, k_x)} \quad (2.5)$$

and this leads to

$$[\Gamma_N^{00}(\varepsilon, k_x)]^2 = \frac{N_{imp}^2 A^2 \hbar^2 V_{imp}}{16\pi^5 (eB)^2} \int_{-\infty}^{\infty} dk'_x J_0^2 \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \left| \int_{-\infty}^{\infty} d\bar{k} \chi_N \left(\frac{\hbar}{eB} \bar{k} \right) \chi_N \left(\frac{\hbar}{eB} [k'_x - k_x - \bar{k}] \right) \right|^2. \quad (2.6)$$

and

$$\Gamma_N^{00}(\varepsilon, k_x) = \left[\frac{N_{imp}^2 A^2 \hbar^2 V_{imp}}{16\pi^5 (eB)^2} \int_{-\infty}^{\infty} dk'_x J_0^2 \left(\frac{g\hbar}{eB} [k_x - k'_x] \right) \left| \int_{-\infty}^{\infty} d\bar{k} \chi_N \left(\frac{\hbar}{eB} \bar{k} \right) \chi_N \left(\frac{\hbar}{eB} [k'_x - k_x - \bar{k}] \right) \right|^2 \right]^{-1/2}. \quad (2.7)$$

This can be write in more compact form as follows

$$\Gamma_N^{00}(\varepsilon, k_x) = \left[\frac{N_{imp}^2 A^2 \hbar^2 V_{imp}}{16\pi^5 (eB)^2} \int_{-\infty}^{\infty} dk'_x J_0^2(g\sigma[k_x - k'_x]) \left| \int_{-\infty}^{\infty} d\bar{k} \chi_N(\sigma\bar{k}) \chi_N(\sigma[k'_x - k_x - \bar{k}]) \right|^2 \right]^{-1/2} \quad (2.8)$$

where

$$g = \frac{eE\omega_0^2}{\hbar\omega(\omega_0^2 - \omega^2)} \quad \sigma = \frac{\hbar}{eB} \quad (2.9)$$

and

$$\chi_N(x) = \frac{\sqrt{\kappa}}{\sqrt{2^N N! \sqrt{\pi}}} \exp\left(-\frac{\kappa^2 x^2}{2}\right) \mathcal{H}_N(\kappa x) \quad \text{with} \quad \kappa \equiv \sqrt{\frac{m_e \omega_0}{\hbar}}. \quad (2.10)$$

Using above definition we can identify Gauss-Hermite functions ($\tilde{\chi}_N$) and this can re-write as

$$\Gamma_N^{00}(\varepsilon, k_x) = \left[\frac{N_{imp}^2 A^2 \hbar^2 V_{imp} \kappa^4}{16\pi^5 (eB)^2} \int_{-\infty}^{\infty} dk'_x J_0^2(g\sigma[k_x - k'_x]) \left| \int_{-\infty}^{\infty} d\bar{k} \tilde{\chi}_N(\sigma\kappa\bar{k}) \tilde{\chi}_N(\sigma\kappa[k'_x - k_x - \bar{k}]) \right|^2 \right]^{-1/2} \quad (2.11)$$

where

$$\tilde{\chi}_N(x) = \frac{1}{\sqrt{2^N N! \sqrt{\pi}}} \exp\left(-\frac{x^2}{2}\right) \mathcal{H}_N(x) \quad (2.12)$$

and this will be simplified to

$$\Gamma_N^{00}(\varepsilon, k_x) = \eta \left[\int_{-\infty}^{\infty} dk_1 J_0^2(\lambda_1[k_x - k_1]) \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_N(\lambda_2 k_2) \tilde{\chi}_N(\lambda_2[k_1 - k_2 - k_x]) \right|^2 \right]^{-1/2} \quad (2.13)$$

where

$$\eta = \left[\frac{N_{imp}^2 A^2 V_{imp}}{16\pi^5} \right]^{1/2}, \quad \lambda_1 = g\sigma, \quad \lambda_2 = \sigma\kappa. \quad (2.14)$$

Now we can analyze the behaviour of the normalized N -th Landau level for broadening as follows

$$\Lambda_N(k_x) \equiv \frac{(1/\tau)_N^{00}}{(1/\tau)_0^{00}|_{E=0}} = \frac{\Gamma_N^{00}(\varepsilon, k_x)}{\Gamma_0^{00}(\varepsilon, k_x)|_{E=0}} \quad (2.15)$$

and this will be

$$\Lambda_N(k_x) = \left[\frac{\int_{-\infty}^{\infty} dk_1 J_0^2(\lambda_1[k_x - k_1]) \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_N(\lambda_2 k_2) \tilde{\chi}_N(\lambda_2[k_1 - k_2 - k_x]) \right|^2}{\int_{-\infty}^{\infty} dk_1 \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_0(\lambda_2 k_2) \tilde{\chi}_0(\lambda_2[k_1 - k_2 - k_x]) \right|^2} \right]^{1/2}. \quad (2.16)$$

Lets calculate these constants for GaAs-based quantum well with following given physical constants and system external paramters.

Physical constant name	Symbol	Value in SI-units
Electron charge	e	$1.602 \times 10^{-19} \text{ C}$
Electron mass	m	$9.109 \times 10^{-31} \text{ kg}$
Reduced Planck's constant	\hbar	$1.054 \times 10^{-34} \text{ kgm}^2\text{s}^{-1}$
Speed of light	c	$2.998 \times 10^8 \text{ ms}^{-1}$
Vacuum permittivity	ε_0	$8.854 \times 10^{-12} \text{ C}^2\text{s}^2\text{kg}^{-1}\text{m}^{-3}$

Table 1: Physical constant values in SI-units

External paramter name	Symbol	Value in SI-units
Average intensity	I	$\tilde{I} \times 100 \text{ W/cm}^2 = \tilde{I} \times 10^6 \text{ W/m}^2$
Magnetic field	B	1.2 T
Driving frequency	ω	$2 \times 10^{12} \text{ rads}^{-1}$
Effective mass	m_e	$0.071 \times m = 6.467 \times 10^{-32} \text{ kg}$

Table 2: System external paramter values. (\tilde{I} is a dimentionless value.)

Therefore we can calculate following values

$$\omega_0 = \frac{eB}{m_e} = 2.97265 \times 10^{12} \text{ s}^{-1} \quad (2.17)$$

$$\sigma = \frac{\hbar}{eB} = 5.4851 \times 10^{-16} \text{ m}^2 \quad (2.18)$$

$$E = \sqrt{\frac{2I}{c\varepsilon_0}} \quad (2.19)$$

$$g = \frac{eE\omega_0^2}{\hbar\omega(\omega_0^2 - \omega^2)} = \frac{e\omega_0^2}{\hbar\omega(\omega_0^2 - \omega^2)} \sqrt{\frac{2I}{c\varepsilon_0}} = 3.80958 \times 10^7 \times \sqrt{\tilde{I}} \text{ m}^{-1} \quad (2.20)$$

$$\kappa = \sqrt{\frac{m_e\omega_0}{\hbar}} = 4.2698 \times 10^7 \text{ m}^{-1} \quad (2.21)$$

Since

$$\lambda_1 = g\sigma = 2.08959 \times 10^{-8} \times \sqrt{\tilde{I}} \text{ m} \quad \text{and} \quad \lambda_2 = \kappa\sigma = 2.34203 \times 10^{-8} \text{ m} \quad (2.22)$$

we can choose our integral dummy variables k_1 , k_2 and momentum variable k_x are in one range as follows

$$k_x, k_1, k_2 \approx 10^8 \text{ m}^{-1} \quad (2.23)$$

Using above values we can re-write the normalized energy broadening of the N -th Landau level as

$$\Lambda_N(k_x) = \left[\frac{\int_{-\infty}^{\infty} dk_1 J_0^2(2.090\sqrt{\tilde{I}} \times [k_x - k_1]) \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_N(2.342 \times k_2) \tilde{\chi}_N(2.342 \times [k_1 - k_2 - k_x]) \right|^2}{\int_{-\infty}^{\infty} dk_1 \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_0(2.342 \times k_2) \tilde{\chi}_0(2.342 \times [k_1 - k_2 - k_x]) \right|^2} \right]^{1/2}. \quad (2.24)$$

Figure 2: Normalized energy band broadening with k_x for different Landau levels ($N = 0, 1, 2, 3, 4$) for $\tilde{I} = 1$.

To check the variability of this expression with k_x value we check it with a constant intensity. Therefore let $\tilde{I} = 1$ and we can re-write above as

$$\Lambda_N(k_x) = \left[\frac{\int_{-\infty}^{\infty} dk_1 J_0^2(2.090 \times [k_x - k_1]) \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_N(2.342 \times k_2) \tilde{\chi}_N(2.342 \times [k_1 - k_2 - k_x]) \right|^2}{\int_{-\infty}^{\infty} dk_1 \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_0(2.342 \times k_2) \tilde{\chi}_0(2.342 \times [k_1 - k_2 - k_x]) \right|^2} \right]^{1/2}. \quad (2.25)$$

then introduce new variable

$$k_1 - k_x = \tilde{k} \longrightarrow dk_1 = d\tilde{k} \quad (2.26)$$

and since k_1 can vary between all the range we can modify our Eq. (2.25) as follows

$$\Lambda_N(k_x) = \left[\frac{\int_{-\infty}^{\infty} d\tilde{k} J_0^2(2.090 \times \tilde{k}) \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_N(2.342 \times k_2) \tilde{\chi}_N(2.342 \times [\tilde{k} - k_2]) \right|^2 \right]^{1/2}}{\int_{-\infty}^{\infty} d\tilde{k} \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_0(2.342 \times k_2) \tilde{\chi}_0(2.342 \times [\tilde{k} - k_2]) \right|^2} \quad (2.27)$$

and letting $\tilde{k} = k_1$ we can find that this is do not depend on the value of k_x . Therefore

$$\Lambda_N = \left[\frac{\int_{-\infty}^{\infty} dk_1 J_0^2(2.090 \times k_1) \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_N(2.342 \times k_2) \tilde{\chi}_N(2.342 \times [k_1 - k_2]) \right|^2 \right]^{1/2}}{\int_{-\infty}^{\infty} dk_1 \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_0(2.342 \times k_2) \tilde{\chi}_0(2.342 \times [k_1 - k_2]) \right|^2} \quad (2.28)$$

Now we can draw the values of Λ_N against k_x to compare the differese of each Landau level's normalized energy band broadening as given in Figure 2.

Now let's check how the Λ_N value change with the applied dressing field's intensity. Using following equation we can identify Λ_N dependency on dressing field's intensity as given in Figure 3.

$$\Lambda_N = \left[\frac{\int_{-\infty}^{\infty} dk_1 J_0^2(2.090\sqrt{\tilde{I}} \times k_1) \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_N(2.342 \times k_2) \tilde{\chi}_N(2.342 \times [k_1 - k_2]) \right|^2 \right]^{1/2}}{\int_{-\infty}^{\infty} dk_1 \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_0(2.342 \times k_2) \tilde{\chi}_0(2.342 \times [k_1 - k_2]) \right|^2} \quad (2.29)$$

Figure 3: Normalized energy band broadening with k_x for different Landau levels ($N = 0, 1, 2, 3, 4$) for $\tilde{I} = 1$.

Here we can identify that we can change the each Landau level normalized energy broadening value using appllied electromagnetic field. When the applied field's intensity increase the energy broadening gets reduced which make changes in conductivity.

To make comparison we can select the experiment parameters from previous analysis on transverse conductivity in [*Ref: Akira Endo and Naomichi Hantno]. In this study we have assumed that the broadening of Landau levels are same and the value for Γ_N non-existing dressing field is 0.24 meV. Therefore in our study for the comparison we can assume that the least Landau level broadening has this value.

$$\Gamma_{N=0}^{00}|_{E=0} = 0.24 \text{ meV} \quad (2.30)$$

Then using the calculated normalized broadening relations for each Landu levels, we can evaluate the energy band broadening values as follows

$$\Gamma_N^{00} = \Lambda_N \times \Gamma_{N=0}^{00}|_{E=0}. \quad (2.31)$$

Therefore, the energy band broadening for Landau level with dressing field can be calculate as

$$\Gamma_N^{00} = \Lambda_N \times \Gamma_{N=0}^{00} \big|_{E=0}. \quad (2.32)$$

and

$$\Gamma_N^{00} = 0.24 \times \Lambda_N \text{ meV}. \quad (2.33)$$

$$\Gamma_N^{00}(\tilde{I}) = 0.24 \times \left[\frac{\int_{-\infty}^{\infty} dk_1 J_0^2(2.090\sqrt{\tilde{I}} \times k_1) \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_N(2.342 \times k_2) \tilde{\chi}_N(2.342 \times [k_1 - k_2]) \right|^2}{\int_{-\infty}^{\infty} dk_1 \left| \int_{-\infty}^{\infty} dk_2 \tilde{\chi}_0(2.342 \times k_2) \tilde{\chi}_0(2.342 \times [k_1 - k_2]) \right|^2} \right]^{1/2} \text{ meV}. \quad (2.34)$$

xx

3 Current Operator in Landau Levels

Now consider about the current density operator for N th Landau level. Since we have already found the exact solution for our time dependent Hamiltonian and we have identified them as Floquet states with quasi-energies. From these solutions we can identify the *Floquet modes* as given in Eq. (??) and using quantum numbers we can represent those states as follows

$$|\phi_\alpha\rangle = |\phi_{n,m}\rangle \equiv |n, k_x\rangle \quad \text{where} \quad k_x = m \frac{2\pi}{L_x} \quad (3.1)$$

Using above complete set of eigenstates of Floquet Hamiltonian we can represent the single particle current operator's matrix element as

$$(\mathbf{j})_{nm,n'm'} = \langle n, k_x | \hat{\mathbf{j}} | n', k'_x \rangle \quad (3.2)$$

where particle current operator for this system will be

$$\hat{\mathbf{j}} = \frac{1}{m} \left(\hat{\mathbf{P}} - e[\mathbf{A}_s + \mathbf{A}_d(t)] \right). \quad (3.3)$$

However, we only consider the transverse conductivity in x direction we can identify that x directional current operator as

$$\hat{j}_x = \frac{1}{m} \left(-i\hbar \frac{\partial}{\partial x} + eBy \right). \quad (3.4)$$

Now we can calculate the matrix elements of x directional current operator's matrix in Floquet mode basis as

$$(j_x)_{nm,n'm'} = \langle n, k_x | \hat{j}_x | n', k'_x \rangle = \langle n, k_x | \frac{1}{m} \left(-i\hbar \frac{\partial}{\partial x} + eBy \right) | n', k'_x \rangle \quad (3.5)$$

and we can evaluate these using Floquet modes derived in Eq. (??) as follows

$$\begin{aligned} (j_x)_{nm,n'm'} &= \int dx \int dy \frac{1}{\sqrt{L_x}} \chi_n(y - y_0 - \zeta(t)) \exp(-ik_x x) \\ &\times \frac{1}{m} \left(-i\hbar \frac{\partial}{\partial x} + eBy \right) \frac{1}{\sqrt{L_x}} \chi_{n'}(y - y_0 - \zeta(t)) \exp(ik'_x x) \end{aligned} \quad (3.6)$$

and this can be simplified as

$$\begin{aligned} (j_x)_{nm,n'm'} &= \frac{1}{mL_x} \int dx \exp(-i(k_x - k'_x)x) \int dy \chi_n(y - y_0 - \zeta(t)) \\ &\times (\hbar k'_x + eBy) \chi_{n'}(y - y_0 - \zeta(t)) \end{aligned} \quad (3.7)$$

and

$$(j_x)_{nm,n'm'} = \frac{1}{m} \delta_{k_x, k'_x} \int dy (\hbar k'_x + eBy) \chi_n(y - y_0 - \zeta(t)) \chi_{n'}(y - y_0 - \zeta(t)). \quad (3.8)$$

Now let $y - y_0 - \zeta(t) = \bar{y}$ and we will get

$$(j_x)_{nm,n'm'} = \frac{1}{m} \delta_{k_x, k'_x} \int d\bar{y} (\hbar k'_x + eB\bar{y} + eBy_0 + eB\zeta(t)) \chi_n(\bar{y}) \chi_{n'}(\bar{y}). \quad (3.9)$$

using definition of y_0 given in Eq. (??) this will be modified to

$$(j_x)_{nm,n'm'} = \frac{1}{m} \delta_{k_x, k'_x} \int d\bar{y} (\hbar k'_x + eB\bar{y} - \hbar k'_x + eB\zeta(t)) \chi_n(\bar{y}) \chi_{n'}(\bar{y}) \quad (3.10)$$

and using integral identities of Gauss-Hermite functions

$$\int dy \chi_n(y) \chi_{n'}(y) = \delta_{n', n} \quad (3.11)$$

$$\int dy y \chi_n(y) \chi_{n'}(y) = \left(\sqrt{\frac{n+1}{2}} \delta_{n',n+1} + \sqrt{\frac{n}{2}} \delta_{n',n-1} \right) \quad (3.12)$$

this becomes

$$(j_x)_{nm,n'm'} = \frac{1}{m} \delta_{k_x, k'_x} eB \left[\left(\sqrt{\frac{n+1}{2}} \delta_{n',n+1} + \sqrt{\frac{n}{2}} \delta_{n',n-1} \right) + \zeta(t) \delta_{n',n} \right] \quad (3.13)$$

Due to complexity we can only consider the constant contribution and we allows only the one-cycle averaged current flow and then we can derive the $s = 0$ components of the Fourier series as

$$(j_{s=0}^x)_{nm,n'm'} = \frac{1}{T} \int_0^T dt \frac{1}{m} \delta_{k_x, k'_x} eB \left[\left(\sqrt{\frac{n+1}{2}} \delta_{n',n+1} + \sqrt{\frac{n}{2}} \delta_{n',n-1} \right) + \frac{eE}{m(\omega_0^2 - \omega^2)} \sin(\omega t) \delta_{n',n} \right] \quad (3.14)$$

and this can be evaluate and get

$$(j_{s=0}^x)_{nm,n'm'} = \frac{eB}{m} \delta_{k_x, k'_x} \left(\sqrt{\frac{n+1}{2}} \delta_{n',n+1} + \sqrt{\frac{n}{2}} \delta_{n',n-1} \right) \quad (3.15)$$

For electric current operator we can introduce the electron's charge and effective mass

$$(j_{s=0}^x)_{nm,n'm'} = \frac{e^2 B}{m_e} \delta_{k_x, k'_x} \left(\sqrt{\frac{n+1}{2}} \delta_{n',n+1} + \sqrt{\frac{n}{2}} \delta_{n',n-1} \right) \quad (3.16)$$

■

4 Floquet-Drude Conductivity in Quantum Hall Systems

The general expression for the conductivity [*Ref: Martin Wackerl Thesis 1.250] with the disorder averaging can be represent as follows

$$\lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] = \frac{-1}{4\pi\hbar A} \int_{\lambda-\hbar\Omega/2}^{\lambda+\hbar\Omega/2} d\varepsilon \left(-\frac{\partial f}{\partial \varepsilon} \right) \times \text{tr} [j_0^x(\mathbf{G}^r(\varepsilon) - \mathbf{G}^a(\varepsilon))j_0^x(\mathbf{G}_0^r(\varepsilon) - \mathbf{G}_0^a(\varepsilon))]. \quad (4.1)$$

where j_0^x and $\mathbf{G}^{r,a}(\varepsilon)$ are x directional current operator matrix and white noise disorder averaged Green function matrix respectively defined against to the *Floquet modes* of the system. Here we have assumed that only $s = 0$ Fourier component of the current operator is contributing to the conductivity.

Now this can be expand in off resonant regime ($\omega\tau_0 \gg 1$) using only central entry Fourier components ($l = l' = 0$) of *Floquet modes* mentioned in Eq. (3.1) as

$$\lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] = \frac{-1}{4\pi\hbar A} \int_{\lambda-\hbar\Omega/2}^{\lambda+\hbar\Omega/2} d\varepsilon \left(-\frac{\partial f}{\partial \varepsilon} \right) \times \frac{1}{V_{k_x}} \sum_{k_x} \sum_n \langle n, k_x | j_0^x(\mathbf{G}^r(\varepsilon) - \mathbf{G}^a(\varepsilon)) j_0^x(\mathbf{G}_0^r(\varepsilon) - \mathbf{G}_0^a(\varepsilon)) | n, k_x \rangle \quad (4.2)$$

and one can evaluate these matrix elements as follows

$$\begin{aligned} \lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] &= \frac{-1}{4\pi\hbar A} \int_{\lambda-\hbar\Omega/2}^{\lambda+\hbar\Omega/2} d\varepsilon \left(-\frac{\partial f}{\partial \varepsilon} \right) \frac{1}{V_{k_x}} \sum_{k_x} \sum_n \frac{1}{L_x^3} \sum_{k_{x1}, k_{x2}, k_{x3}} \sum_{n_1, n_2, n_3} \\ &\times \langle n, k_x | j_0^x | n_1, k_{x1} \rangle \langle n_1, k_{x1} | (\mathbf{G}^r(\varepsilon) - \mathbf{G}^a(\varepsilon)) | n_2, k_{x2} \rangle \\ &\times \langle n_2, k_{x2} | j_0^x | n_3, k_{x3} \rangle \langle n_3, k_{x3} | (\mathbf{G}^r(\varepsilon) - \mathbf{G}^a(\varepsilon)) | n, k_x \rangle \end{aligned} \quad (4.3)$$

Since we can diagonalize the impurity averaged Green's function using unitary transformation ($\mathbf{T} = |n, k_x\rangle$) [*Ref: Martin Wackerl - Paper] and we can evaluate the matrix element of difference between retarded and advanced Green's function as follows [*Ref: My report 2.535]

$$\langle n_1, k_{x1} | \mathbf{T}^\dagger (\mathbf{G}^r(\varepsilon) - \mathbf{G}^a(\varepsilon)) \mathbf{T} | n_2, k_{x2} \rangle = \left[\frac{2i\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T}) \delta_{n_1, n_2} \delta_{k_{x1}, k_{x2}}}{\left(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_{n_1}\right)^2 + [\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})]^2} \right] \quad (4.4)$$

and

$$\langle n_3, k_{x3} | \mathbf{T}^\dagger (\mathbf{G}^r(\varepsilon) - \mathbf{G}^a(\varepsilon)) \mathbf{T} | n, k_x \rangle = \left[\frac{2i\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T}) \delta_{n_3, n} \delta_{k_{x3}, k_x}}{\left(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_n\right)^2 + [\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})]^2} \right] \quad (4.5)$$

Then applying the results we derived in previous section (4.21) we can calculate the conductivity

$$\begin{aligned} \lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] &= \frac{-1}{4\pi\hbar A} \int_{\lambda-\hbar\Omega/2}^{\lambda+\hbar\Omega/2} d\varepsilon \left(-\frac{\partial f}{\partial \varepsilon} \right) \frac{1}{V_{k_x}} \sum_{k_x} \sum_n \frac{1}{V_{k_x}^3} \sum_{k_{x1}, k_{x2}, k_{x3}} \sum_{n_1, n_2, n_3} \\ &\times \frac{e^2 B}{m_e} \delta_{k_x, k_{x1}} \left(\sqrt{\frac{n+1}{2}} \delta_{n_1, n+1} + \sqrt{\frac{n}{2}} \delta_{n_1, n-1} \right) \left[\frac{2i\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T}) \delta_{n_1, n_2} \delta_{k_{x1}, k_{x2}}}{\left(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_{n_1}\right)^2 + [\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})]^2} \right] \\ &\times \frac{e^2 B}{m_e} \delta_{k_{x2}, k_{x3}} \left(\sqrt{\frac{n_2+1}{2}} \delta_{n_3, n_2+1} + \sqrt{\frac{n_2}{2}} \delta_{n_3, n_2-1} \right) \left[\frac{2i\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T}) \delta_{n_3, n} \delta_{k_{x3}, k_x}}{\left(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_n\right)^2 + [\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})]^2} \right] \end{aligned} \quad (4.6)$$

and this will be modified to

$$\begin{aligned} \lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] &= \frac{-1}{4\pi\hbar A} \int_{\lambda-\hbar\Omega/2}^{\lambda+\hbar\Omega/2} d\varepsilon \left(-\frac{\partial f}{\partial \varepsilon} \right) \frac{1}{V_{k_x}} \sum_{k_x} \sum_n \sum_{n_1, n_2} \\ &\times \frac{e^2 B}{m_e} \left(\sqrt{\frac{n+1}{2}} \delta_{n_1, n+1} + \sqrt{\frac{n}{2}} \delta_{n_1, n-1} \right) \left[\frac{2i \text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T}) \delta_{n_1, n_2}}{(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_{n_1})^2 + [\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})]^2} \right] \\ &\times \frac{e^2 B}{m_e} \left(\sqrt{\frac{n_2+1}{2}} \delta_{n, n_2+1} + \sqrt{\frac{n_2}{2}} \delta_{n, n_2-1} \right) \left[\frac{2i \text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})}{(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_n)^2 + [\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})]^2} \right] \end{aligned} \quad (4.7)$$

and the only non-zero term would be

$$\begin{aligned} \lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] &= \frac{-1}{4\pi\hbar A} \frac{e^4 B^2}{m_e^2} \int_{\lambda-\hbar\Omega/2}^{\lambda+\hbar\Omega/2} d\varepsilon \left(-\frac{\partial f}{\partial \varepsilon} \right) \frac{1}{V_{k_x}} \sum_{k_x} \sum_n \left(\frac{n+1}{2} \right) \\ &\times \left[\frac{2i \text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})_{\varepsilon_{n+1}}}{(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_{n+1})^2 + [\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})_{\varepsilon_{n+1}}]^2} \right] \left[\frac{2i \text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})_{\varepsilon_n}}{(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_n)^2 + [\text{Im}(\mathbf{T}^\dagger \sum^r \mathbf{T})_{\varepsilon_n}]^2} \right] \end{aligned} \quad (4.8)$$

■

Then using the following identity derived in [*Ref: My report 2.509]

$$\left(\frac{1}{\tau(\varepsilon, k_x)} \right)_{ll} = -2 \text{Im} \left[(\mathbf{T}^\dagger \sum^r \mathbf{T})_{\varepsilon} \right]_{ll} \quad (4.9)$$

using central element of the inverse scattering time matrix we can modify our result as

$$\begin{aligned} \lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] &= \frac{1}{4\pi\hbar A} \frac{e^4 B^2}{m_e^2} \int_{\lambda-\hbar\Omega/2}^{\lambda+\hbar\Omega/2} d\varepsilon \left(-\frac{\partial f}{\partial \varepsilon} \right) \frac{1}{V_{k_x}} \sum_{k_x} \sum_n \left(\frac{n+1}{2} \right) \\ &\times \left[\frac{\left(\frac{1}{\tau(\varepsilon_{n+1}, k_x)} \right)}{\left(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_{n+1} \right)^2 + \left(\frac{1}{2\tau(\varepsilon_{n+1}, k_x)} \right)^2} \right] \left[\frac{\left(\frac{1}{\tau(\varepsilon_n, k_x)} \right)}{\left(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_n \right)^2 + \left(\frac{1}{2\tau(\varepsilon_n, k_x)} \right)^2} \right] \end{aligned} \quad (4.10)$$

We have identified that the inverse scattering time matrix's central element is not k_x dependent we can get the sum over all available momentum space in x direction. However by considering the condition that the center of the force of the oscillator y_0 must physically lie within the system $-L_y/2 < y_0 < L_y/2$, one can derive that

$$-\frac{m_e \omega_0 L_y}{2\hbar} \leq k_x \leq \frac{m_e \omega_0 L_y}{2\hbar} \quad (4.11)$$

and we can derive that

$$\frac{1}{V_{k_x}} \sum_{k_x} = \frac{m_e \omega_0 L_y}{\hbar V_{k_x}} = 1 \quad (4.12)$$

Therefore Eq. (4.10) modified to

$$\begin{aligned} \lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] &= \frac{e^2 \omega_0^2}{4\pi\hbar A} \int_{\lambda-\hbar\Omega/2}^{\lambda+\hbar\Omega/2} d\varepsilon \left(-\frac{\partial f}{\partial \varepsilon} \right) \sum_n \left(\frac{n+1}{2} \right) \\ &\times \left[\frac{\left(\frac{1}{\tau(\varepsilon_{n+1})} \right)}{\left(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_{n+1} \right)^2 + \left(\frac{1}{2\tau(\varepsilon_{n+1})} \right)^2} \right] \left[\frac{\left(\frac{1}{\tau(\varepsilon_n)} \right)}{\left(\frac{1}{\hbar}\varepsilon - \frac{1}{\hbar}\varepsilon_n \right)^2 + \left(\frac{1}{2\tau(\varepsilon_n)} \right)^2} \right] \end{aligned} \quad (4.13)$$

Then using Fermi-Dirac distribution as our partial distribution function (f) for this system

$$f(\varepsilon) = \frac{1}{[\exp(\varepsilon - \varepsilon_F)/k_B T] + 1} \quad (4.14)$$

where k_B is Boltzmann constant, T is absolute temperature and ε_F is Fermi energy of the system. Using above distribution, for extremely low temperatures we can approximate that

$$-\frac{\partial f(\varepsilon)}{\partial \varepsilon} \approx \delta(\varepsilon - \varepsilon_F) \quad (4.15)$$

and this will more simplify our derivation of conductivity as

$$\lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] = \frac{e^2 \omega_0^2}{4\pi \hbar A} \sum_n \left(\frac{n+1}{2} \right) \left[\frac{\left(\frac{1}{\tau(\varepsilon_{n+1})} \right)}{\left(\frac{1}{\hbar} \varepsilon_F - \frac{1}{\hbar} \varepsilon_{n+1} \right)^2 + \left(\frac{1}{2\tau(\varepsilon_{n+1})} \right)^2} \right] \left[\frac{\left(\frac{1}{\tau(\varepsilon_n)} \right)}{\left(\frac{1}{\hbar} \varepsilon_F - \frac{1}{\hbar} \varepsilon_n \right)^2 + \left(\frac{1}{2\tau(\varepsilon_n)} \right)^2} \right] \quad (4.16)$$

Now introduce a new parameter with a physical meaning of scattering-induced broadening of the Landau level as follows

$$\Gamma_n \equiv \Gamma(\varepsilon_n) \equiv \left(\frac{\hbar}{2\tau(\varepsilon_n)} \right) \quad (4.17)$$

and then we can re-write Eq. (4.16) as follows

$$\lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] = \frac{e^2 (\hbar \omega_0)^2}{\pi \hbar A} \sum_n \left(\frac{n+1}{2} \right) \left[\frac{\Gamma(\varepsilon_{n+1})}{(\varepsilon_F - \varepsilon_{n+1})^2 + \Gamma^2(\varepsilon_{n+1})} \right] \left[\frac{\Gamma(\varepsilon_n)}{(\varepsilon_F - \varepsilon_n)^2 + \Gamma^2(\varepsilon_n)} \right] \quad (4.18)$$

$$\lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] = \frac{e^2 (\hbar \omega_0)^2}{\pi \hbar A} \sum_n \left(\frac{n+1}{2} \right) \left[\frac{\Gamma_{n+1}}{(\varepsilon_F - \varepsilon_{n+1})^2 + \Gamma_{n+1}^2} \right] \left[\frac{\Gamma_n}{(\varepsilon_F - \varepsilon_n)^2 + \Gamma_n^2} \right] \quad (4.19)$$

Now use new dimensionless parameters

$$X_F \equiv \frac{\varepsilon_F}{\hbar \omega_0} - \frac{1}{2} \quad (4.20)$$

and

$$\gamma_n \equiv \frac{\Gamma_n}{\hbar \omega_0}. \quad (4.21)$$

Therefore the Eq. (4.19) leads to

$$\lim_{\omega \rightarrow 0} \text{Re}[\sigma^{xx}(0, \omega)] = \frac{e^2}{\hbar} \frac{1}{2\pi A} \sum_n (n+1) \left[\frac{\gamma_{n+1}}{(X_F - n - 1)^2 + \gamma_{n+1}^2} \right] \left[\frac{\gamma_n}{(X_F - n)^2 + \gamma_n^2} \right] \quad (4.22)$$

■
